

Worcester VTS - Evaluation Form

ST1 ST2
ST3
(please circle)

7 October 2010

Aims: / Objectives:

Clinical Investigations

- 1) GP referral pathways to neurophysiology services
- 2) Interpretation of some challenging blood results
- 3) Investigations for some common presentations to general practice and their interpretation

Comments / Feedback

Liked the introduction. Group work with case discussions very good to allow everyone a chance to think. Enjoyed the neurophysiology talk, learnt a lot.

Very useful session - well thought out. Relevant to primary care. Interactive.

Useful to look at guidelines in ST1 session.

Ice breaker very good. Individual session and cases for tests very good. Far more valuable to have the thyroid and tired all the time patient! NICE guidelines useful to get out of the specialty mode.

Group - 1st Session - Very good way of doing Clinical Investigation topic. Actually, learning from the tasks and thinking what you and other people would do. Enjoyable.

2nd Session - Good case discussion and use of incorporating guidelines.

Interesting, allows time to discuss our own cases. Useful learning exercise.

The Balint Group was very useful. Threw some light on how difficult patients present and how to deal with them. (or at least how to manage your feelings about them).

Good, well done.

Good practical session. Nice discussion of problem patient.

Useful. Good presentations. It would be great if we can match them in NICE guidelines.

Well done.

Excellent.

Useful. Not exhaustive.

Clinical Investigations; - Useful information given - help in GP. May be avoid unnecessary investigations in the future. Case discussions - Always interesting.

Excellent introduction - good way to start session. Neurophysiology interesting and made me more aware of services. Blood results - challenging and very relevant to GP.

Good small group sessions to clinical cases - very relevant.

Need better handouts for small group.
